

Exercise: Todo List / Task Manager App

Objective:

Create a simple task management (Todo List) app using **React Native**, where data is stored using **React state** (useState). Users should be able to add, mark as complete, and delete tasks.

Functional Requirements:

1. The **main screen** displays the list of current tasks.
2. There is an **input field** for the user to add a new task.
3. Each task should display:
 - Task title (text)
 - A "Complete" button (toggle)
 - A "Delete" button
4. When "Complete" is pressed:
 - The task title is shown with a strikethrough
 - Or styled differently to indicate it's completed
5. When "Delete" is pressed:
 - The task is removed from the list
6. No need to persist data (state can be lost on app reload)

Optional Challenges (if core features are completed):

- Add filter options: "All", "Completed", "Incomplete"
- Allow editing a task
- Sort tasks by creation time
